Safety Interlock Switch with Guard Locking

KL4-SS Operating Instructions

IMPORTANT NOTE:
Read and understand these instructions before installing, operating, or maintaining this equipment.
The product is designed to be a component of a customised safety orientated control system. It is the responsibility of each manufacturer to ensure the correct overall functionality of its systems and machines. IDEM, its subsidiaries and affiliates, are not in a position to guarantee all of the characteristics of a given system or product not designed by IDEM.

Application and Operation:
The KL4-SS Safety Interlock Switch with Guard Locking is designed to fit to the leading edge of sliding or hinged guard doors to provide positively operated switching contacts and provide a tamper resistant key mechanism. The KL4-SS is designed to provide robust position interlock detection and holding closed of moving guards. The switch is rigidly mounted to the frame of the guard or machine. The actuator is fitted to the moving part (frame) of the guard and is aligned to the switch entry aperture. The actuator profile is designed to match a cam mechanism within the switch head and provides a positively operated not easily defeatable interlock switch. When the guard is closed and the actuator is inserted into the switch the safety contacts close, the actuator is locked and the machine start circuit can be enabled. When the solenoid is energised the safety contacts are positively opened, the machine stop circuit is broken and the guard door can be opened.

Installation:
1. Installation of all interlock switches must be in accordance with a risk assessment for the individual application. Installation must only be carried out by competent personnel and in accordance with these instructions.
2. M5 mounting bolts must be used to fix the switch and actuator, the tightening torque to ensure reliable fixing is 4.0 Nm.
To prevent loosening of the switch after installation, always fix the M5 mounting bolts with a thread-locking compound or secure using self-locking nuts.
Tightening torque for the head bolts is 1.5Nm.
Only use the correct size gland for the conduit entry and cable outside diameter.
Tightening torque for the connection terminal screws is 0.7 Nm, max conductor size is 1.0 sq.mm.
The switch head position can be selected by removing the actuator, loosening the 4 head bolts and then rotating the head to the position required. Re-tighten the head bolts and then check actuator insertion and withdrawal.
Tightening torque for the head bolts is 1.5Nm.
The switching is supplied with removable conductor links fitted 41/42 and 31/32. If required by the control circuit these may be removed to offer independent monitoring of the solenoid locking function or the actuator.
3. Always fit a mechanical stop to the guard to prevent damage to the front of the switch.
Set the actuator gap to 3mm when the guard is closed and against the stop. (See Fig. A.)
Use alignment guides to ensure that the actuator enters the switch without interfering with the sides of the aperture.
Ensure access to at least one of the manual release points.
Always fit the aperture plug to the unused entry aperture to prevent debris entering the switch mechanism.
4. After installation check operation of all control circuits and the locking function.
For applications with a run down time after removing power, ensure that the correct timing allowance has been before energising the solenoid.
LED 1 RED will illuminate when power is applied to A1 and A2 (solenoid feed).
LED 2 GREEN (if used) will be illuminated when the actuator is locked.
LED 2 GREEN will be illuminated when the actuator is locked.
To prevent loosening of the switch after installation, always fix the M5 mounting bolts with a thread-locking compound or secure using self locking nuts.
LED 1 RED will illuminate when power is applied to A1 and A2 (solenoid feed).
LED 2 GREEN (if used) will be illuminated when the actuator is locked.

Maintenance:
Every Week: Check correct operation of all circuits and the Lock function.
If the actuator shows signs of bending or the switch head housing displays mechanical damage then remove and replace the whole device.
IDEM will not accept responsibility for failure of the switch functions if the installation and maintenance requirements shown in this sheet are not implemented.
Never attempt to remove the internal screws or parts of the mechanism, any attempt to do so will invalidate the product warranty. Never attempt to repair any switch.

5. IMPORTANT!
At installation choose the status of Terminals 33 and 34 by setting the slide switch inside the switch housing.

LED1 Status of Solenoid
LED2 Status of Lock
(Terminals 33 – 34 are selectable to be used either power feed to LED2 or as a voltage free auxiliary circuit to indicate lock status). See Fig. B.

THESE INSTRUCTIONS FORM PART OF THE PRODUCT WARRANTY.
**Safety Interlock Switch with Guard Locking**

Application Example: Door Interlock with Guard locking - Dual Channel (non-monitored).

The guard is locked closed until the solenoid is energized. The solenoid can only be energized when the auxiliary contacts (A) of contactors K1 and K2 are closed.

When the lock release button is pushed the locking mechanism is released and the switch contacts 11-12 and 21-22 are opened. These contacts are in series with contactor coils of K1 and K2 and will prevent re-start whilst the guard is open. If after pressing the Stop button either contactor K1 or K2 stays closed the motor will stop but the solenoid cannot be energized or the guard opened.

LED 1 provides visual indication of solenoid power applied.

LED 2 provides visual indication of guard locked and machine able to start.

System is shown with machine stopped, guard closed and locked, and the solenoid able to be energised.

---

**Conforming to Standard:**

EN1088, IEC60947-5-1, EN60204-1, EN60204-1, ISO13849-1, EN62061, EN954-1, UL508

**Safety Classification and Reliability Data:**

- **Mechanical Reliability B10d**
  
  $2.5 \times 10^6$ operations at 100mA load

- **Up to Category 4 with Safety Relay**

- **ISO13849-1 up to PLe depending upon system architecture**

- **EN62061 up to SIL3 depending upon system architecture**

**Safety Data – Annual Usage**

- **PFHd**
  
  $3.44 \times 10^{-6}$

- **Proof Test Interval (Life)**
  
  35 years

- **MTTFd**
  
  356 years

**Solenoid Voltage (by part number)**

- 24V ac/dc
- 110V ac
- 230V ac

**Solenoid Wattage**

- 12W

**LED 2 Supply Voltage**

- 24V dc

**Utilization Category**

- AC15
- A300

**Thermal Current (Ith)**

- 5A

**Rated Insulation/Withstand Voltages**

- 600VAC/2500VAC

**Travel for Positive Opening**

- 10mm

**Maximum Approach/Withdrawal Speed**

- 175mm Standard 100 Heavy Duty

- 600mm/s

**Body Material**

- Stainless Steel 316

**Enclosure Protection**

- IP69K/IP67

**Operating Temperature**

- IEC 68-2-6, 10-55Hz+1Hz

**Vibration**

- Excursion: 0.35mm, 1 octave/min

**Conduit Entry**

- Various (see Sales Part Numbers)

**Fixing**

- 4 x M5

---

**KL4-SS REQUEST BUTTON VERSION: (MOMENTARY ACTION)**

**Wire colours (NC/NO):**

Black = common

Brown = NC

Blue = NO

---

**Notes:**

1. Pins 10 and 11 can be internally re-wired for use with circuit 43/44.

2. Request button NC (Brown wire) can be internally re-wired in place of the NO (Blue wire).
